Summary

One core sample from tank SY-103, core 62, which was composed of fifteen (15) segments, was received by the 222-S laboratories. This core sample underwent Safety Screening Analysis (DSC, TGA, and Alpha Total) in accordance with references (1) (2) and (3) above. TGA results for segment 7 (S94T000056) and segment 8 (S94T000057) were below the 17% limit. These samples did not contain a significant exotherm by DSC. The lower half of segments 13 (S94T000091) and 14 (S94T000092) exceeded the DSC limit of 523 joules/g (dry).

Sample Receipt and Extrusion

Core 62 Segment 1

Segment 1 was sampled on 8/19/94, received at the 222-S laboratory on 8/22, and extruded 8/24. Segment 1 contained approximately 262 mls of drainable liquid, and 22 grams of solid sample. The liquid was turbid and medium brown in color, with an estimated density of 1.52 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow cone" ice. The sampler efficiency was calculated at 91% recovery. A small quantity of liner liquid (<5mls) was present, but was not collected.

Hanford Operations and Engineering Contractor for the US Department of Energy

Core 62 Segment 2
Segment 2 was sampled on 8/19/94, received at the 222-S laboratory on 8/22, and extruded 8/24. Segment 2 contained approximately 272 mls of drainable liquid, and 9.6 grams of solid sample. The liquid was turbid and medium brown in color, with an estimated density of 1.50 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow cone" ice. The sampler efficiency was calculated at 91% recovery. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 3
Segment 3 was sampled on 8/23/94, received at the 222-S laboratory on 8/25, and extruded 8/26. When the valve was first opened, no liquid sample appeared. Apparently a plug of solid had formed. When the extrusion began, this solid plug was pushed onto the sample tray, followed rapidly by the drainable liquid. Some liquid was lost out the back of the sample tray, and much of the solid was carried into the drainable liquid jar with the liquid. Approximately 262 (+/- 10) mls of drainable liquid was present in the sampler. The amount of solids collected from the sampling tray was 5.8 grams. The liquid was turbid and medium brown in color, with an estimated density of 1.52 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow cone" ice. The sampler efficiency was calculated at 91% recovery. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 4
Segment 4 was sampled on 8/23/94, received at the 222-S laboratory on 8/25, and extruded 8/26. Segment 4 contained approximately 295 mls of drainable liquid, and 33 grams of solid sample. The liquid was turbid and brown in color, slightly lighter brown than previous samples, with an estimated density of 1.34 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow cone" ice. The sampler efficiency was calculated at 100% recovery. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 5
Segment 5 was sampled on 9/8/94, received at the 222-S laboratory on 9/9, and extruded 9/12. Segment 5 contained approximately 270 mls of drainable liquid, and 36 grams of solid sample. The liquid was turbid and medium brown in color, with an estimated density of 1.48 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow cone" ice. The sampler efficiency was calculated at 95% recovery. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 6
Segment 6 was sampled on 9/13/94, received at the 222-S laboratory on 9/15, and extruded 9/16. Segment 6 contained approximately 260 mls of drainable liquid, and 34 grams of solid sample. The liquid was turbid and medium brown in color, with an estimated density of 1.48 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow

cone" ice. The sampler efficiency was calculated at 92% recovery. About 10 mls of liner liquid was collected.

Core 62 Segment 7
Segment 7 was sampled on 9/13/94, received at the 222-S laboratory on 9/15, and extruded 9/16. Segment 7 contained approximately 262 mls of drainable liquid, and 22 grams of solid sample. The liquid was turbid and medium brown in color, with an estimated density of 1.53 g/ml. No organic layer was observed. The solids resembled dirty ice crystals, much like "snow cone" ice. The sampler efficiency was calculated at 88% recovery. About 7mls of liner liquid was collected.

Core 62 Segment 8
Segment 8 was sampled on 9/13/94, received at the 222-S laboratory on 9/15, and extruded 9/19. Segment 8 contained approximately 295 mls of drainable liquid, and 22 grams of solid sample. The liquid was turbid and medium brown in color, with an estimated density of 1.47 g/ml. No organic layer was observed. The solids were composed of the usual "snow cone" ice, and a gelatin like phase. The sampler efficiency was calculated at 98% recovery. About 10mls of liner liquid was collected.

Core 62 Segment 9
Segment 9 was sampled on 9/13/94, received at the 222-S laboratory on 9/15, and extruded 9/19. Segment 9 contained approximately 35 mls of dark brown and opaque drainable liquid, with an estimated density of 1.64 g/ml. No organic layer was observed. About 369 grams of solids were collected. The solid sample did not retain its shape following extrusion, but spread slowly across the sample tray. The dark brown solids appeared homogeneous, with the consistency of thin, wet mud. The sampler efficiency was calculated at 92% recovery. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 10
Segment 10 was sampled on 9/13/94, received at the 222-S laboratory on 9/15, and extruded 9/20. Segment 10 contained no drainable liquid. The total weight of solid material collected was 381 grams. The lower half segment was dark brown and retained the shape of the sampler following extrusion. The upper half was more wet and did not retain its shape, with the upper quarter being similar in appearance to segment 9. The sampler recovery was estimated at 85%. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 11
Segment 11 was sampled on 9/16/94, received at the 222-S laboratory on 9/19/94, and extruded 9/21. Segment 11 contained no drainable liquid. The total weight of solid material collected was 431 grams. Segment 11 was slightly different in color than the previous segment, having a grey verses a red cast to the otherwise homogeneous brown color. This change occurred gradually, without a layering effect. The sample retained its shape

following extrusion, and was slightly pitted at the surface. The sampler recovery was estimated at 95%. About 10mls of liner liquid was collected.

Core 62 Segment 12
Segment 12 was sampled on 9/16/94, received at the 222-S laboratory on 9/19, and extruded 9/22. Segment 12 contained no drainable liquid. The total weight of solid material collected was 382 grams. Segment 12 was grey brown in color, soft and damp in texture, much like segment 11. The sample retained its shape following extrusion, and was slightly pitted at the surface. The sampler recovery was estimated at 95%. About 10mls of liner liquid was collected.

Core 62 Segment 13
Segment 13 was sampled on 9/16/94, received at the 222-S laboratory on 9/19, and extruded 9/23. Segment 13 contained no drainable liquid. The total weight of solid material collected was 429 grams. Segment 13 was grey brown in color, soft and damp in texture, much like segments 11 and 12. The upper half of segment 13 was more damp than the lower half. The sample retained its shape following extrusion, and was slightly pitted at the surface. The sampler recovery was estimated at 95%. About 34mls of liner liquid was collected.

Core 62 Segment 14
Segment 14 was sampled on 9/19/94, received at the 222-S laboratory on 9/21, and extruded 9/23. Segment 14 contained no drainable liquid. The total weight of solid material collected was 352 grams. About 10 inches of solids were extruded, followed by a 4 inch air gap, then 4 to 5 inches of solids. Segment 14 was grey brown in color, soft and damp in texture, and was slightly pitted at the surface. The sampler recovery was estimated at 80%. A small quantity of liner liquid (<5mls) was present, but was not collected.

Core 62 Segment 15
Segment 15 was sampled on 9/19/94, received at the 222-S laboratory on 9/21, and extruded 9/26. Segment 15 was composed primarily of drainable liquid, approximately 125 mls of which were collected. The density of the liquid is estimated at 1.31 g/ml. When the sampler valve was opened, an estimated 20 mls of liquid sprayed onto the hot cell wall. The amount of solids was difficult to determine due to the runny texture. Ten (10) grams were collected. Sample recovery was estimated at 52%. About 49 grams of liner liquid was collected.

Analytical Results

TGA (Moisture)
The weight percent water by Thermogravimetric Analysis (TGA) was performed utilizing procedure LA-560-112. Two samples were analyzed below the TCP notification limit of 17% water. A reanalysis, due to RPD, of segment 7

(S94T000056) gave a result of 15.3%. Notification was made on 11/3/94. Segment 8 (S94T000057) was analyzed at 13.67% water, and a reanalysis confirmed this at 15.27% water. Notification was made on 10/25/94. Neither of these samples contained a significant exotherm by DSC.

Notification was made on 9/23/94 of four samples which had results below the 17% limit. Review of these samples (S94T00004, 11, 20, 28) in light of the body of work indicated that the initial notification was based on an overly conservative interpretation of the data. The results were reintegrated, and all the samples were then above the 17% limit. The reintegrated results appear in this report.

Relatively few problems were encountered with the sludge and drainable liquid samples. Significant difficulty was encountered analyzing the "snow cone" ice solids. These samples were observed at extrusion as crystalline in appearance. At analysis these solids were often reported as a heavy, sticky syrup. The following samples were reanalyzed due to large RPD: segment 2 (S94T000011), segment 4 (S94T000028), segment 7 (S94T000056), and segment 8 (S94T000057). The reanalyses are identified on each table by an integer in the "R" column, which follows the Sample# column. A "1" in this column denotes the first rerun analysis. In most cases, the rerun analysis only substantiated the apparent nonhomogeneous nature of the samples. Four samples, segment 3 (S94T000020), segment 5 (S94T000036), segment 6 (S94T000055), and the upper half of segment 14 (S94T000089), also exceeded the 10% precision criteria, but by a much smaller amount. These samples were not rerun due to the high dose rate of the samples, and the low probability of improving the results; which is a factor of the small amount of sample used (10-20mg) and the homogeneity problems mentioned above. All samples met the TCP accuracy criteria of 10%.

DSC

Differential thermal analyses were performed using procedure LA-514-113, and a Mettler Model 20 Differential Scanning Calorimeter (DSC). Two samples were analyzed above the safety screen notification limit of 523 joules/g. The results for the lower half of segment 13 (S94T000091) were 619 joules/g (sample) and 641 joules/g (duplicate). The lower half of segment 14 (S94T000092) sample result was 531 joules/g.

Once again, the sludge and liquid samples were relatively well behaved for the DSC analysis. The "snow cone" solids presented many challenges. One of the first samples analyzed (S94T000004) appeared to have a significant exotherm at higher temperatures. The sample was analyzed again to 600° C to quantify the apparent exotherm. Upon examination it was determined that the sample had contaminated the DSC sensor, causing a severe baseline shift in the higher temperature region. The sensor was replaced, and to extend the life of the sensor, future samples were analyzed to 450° C maximum. In some cases, due to contamination of the sensor, a baseline subtraction routine was used to integrate the data (S94T000004, 28, 92, 105, 106). Two

samples were inadvertently run in air instead of nitrogen (S94T000085, 105), but this did not appear to have a negative effect on the analyses. The duplicates were run in nitrogen.

No limit was specified in the TCP for the DSC precision. The majority of results did not exceed 20% RPD. Segment 11, lower half (S94T000071) was reanalyzed due to a high RPD. The reanalysis indicated a homogeneity problem. All results met the TCP accuracy criteria of 10%.

Alpha Total

The Alpha Total analyses were performed using procedure LA-508-101. The highest alpha result recorded for core 62 was 1.65 uCi/g. This result was for the lower half of segment 14 (S94T000097). This is well below the notification limit of 41 uCi/g. The majority of alpha results for core 62 were below the detection limit. This is due to the very high beta to alpha activity ratio in these samples. Large dilutions are necessary to reduce the beta activity on the sample mount to acceptable levels. The "less than" values reported are significantly below the notification limit.

Two standard results (segments 2 and 4) slightly exceeded the TCP specified accuracy limit of 10%. The laboratory internal quality control limits, which are performance based, were not exceeded, so a rerun was not requested. The TCP specified precision limit was exceeded for a number of results (segments 9, 10, and 14). This is again due to the large dilution factor, which reduces the alpha activity present on the sample mount to very low levels. The counting statistics in this case are poor, so attaining the required precision becomes very difficult. No reruns were requested. Spike recoveries ranged from 92-119%, which met the laboratory internal quality control limits. The TCP does not specify spike limits. Spike analyses were required by the TCP for each matrix. Results have been provided for each sample.

The data tables provided in this package were created using the LABCORE computer system. The production of these tables has been automated, and attempts were made to reproduce as closely as possible the format used in previous safety screen reports. Any suggestions for improving the format and usefulness of these tables would be appreciated.

Sincerely,

Andrew Rice,
Project Coordinator

Data Entry Comments:
Sample S94T000004 has a small exotherm at 247°C. The sample caused damage to the sensor which made results above 300°C unreproducible. Sample S94T000011 was run on a new sensor. J. M. L.

Data Entry Comments:
The first time this sample (S94T000020) was run it appeared to have an exotherm of 29.2 J/g at 247°C and 545 J/g at 416°C on an upwards slopey baseline. The second time it was run the baseline appeared to shift at 300°C upwards then tail downward. There appears to be an exotherm of 56.7 J/g at 236°C. Inspection of the DSC cell the morning after these were run revealed that material from the sample had deposited on the sensor having adverse affects on the sensor and baseline. Jamie Fryer

Data Entered 10/5/94, JMF, not marked complete. Completed + posted 10/11/94 JMF

Data Entry Comments:

Sample S94T000055 has second step at 129°C of 17.64% on the sample and 17.76% on the duplicate. This is probably due to chemically bound water. I summed both steps as total moisture.

Units shown for QC (SPK) may not reflect the actual units.
